

Architecture

These images all show photos taken around the college that were made black and white using the photoshop gradient tool , each image was carefully thought out to make certain things stand out such as the image in the top left having a sense of powerful presence as the image focuses on the top of the building at an angle as if the building is looking down on the viewer , the image also has a sense of symmetry

Keith Dotson

As seen in the images , the angle at which they're taken effects how well the image works and how an image can be portrayed , for example both buildings were large however the angle at which they're took makes one seem more royal than the other . This sort of thing is also similar in camera obscura because the image produced can be altered through angles .
